North Korean hackers just used VS Code to spread malware. They exploited auto-run tasks to distribute StoatWaffle.

The Contagious Interview campaign's malicious actors have found a novel approach to infect systems. They leveraged VS Code projects to hide malware.

Our team's on it, but broader implications loom - we're questioning development tool supply chain integrity.

Don't know about you, but we're patching this ASAP.

SIEMs: which ones would catch this backdoor first? #StoatWaffle #VSCodeSecurity #DFIR
