Most implementations of zero trust are just marketing fluff, hiding weak identity and access management.

Our team recently assessed various zero-trust architectures and found little to no substance behind the hype. Most were just rebranded perimeter defenses.

Perimeters don't work. They're a relic of the past, not a security strategy. Identity-centric security requires a fundamentally different approach.

Don't waste your time slapping a "zero trust" label on your existing infrastructure. It's a cheap cop-out, a PR stunt, not a genuine security upgrade.

If you're relying on outdated perimeter defenses, stop. If you're actually implementing identity and access management, congratulations. You're not alone.

Disagree? Prove me wrong.
