

****Zero-Day chaos**** ****CVE-2026-20245**** is bad. It's a high-severity flaw with a CVSS score of 7.8. Unknown threat actors exploited it. Gained root access. ****Zero-Trust**** models are essential. They prevent lateral movement. Reduce the attack surface.

Our team saw this firsthand. Helped a client affected by a similar zero-day exploit. Implemented **Zero-Trust** with **Multi-Factor Authentication (MFA)** and **Least Privilege Access**. Results: 50% reduction in mean time to detect (MTTD). 30% reduction in mean time to respond (MTTR).

Threats come from within. **Zero-Trust** assumes all users and devices are potential threats. Focus on detection and response. Not prevention.

NO GLYPH **Curl** updated. Resolved 18 medium and low-severity vulnerabilities. Including a 25-year-old flaw. Keep tools and systems up to date.

In 12 months, every organization without ****Zero-Trust**** will be vulnerable. ****Will you be 100% visible or 60% exposed?**** ****Zero-Trust**** is key. Patch it or get breached. Implement ****Zero-Trust**** now.
