

****Cyber war**** FortiBleed targets 430,000 FortiGate firewalls. It's bad. 110 million credentials harvested. Firewalls are not secure. They can be exploited. Massive data breaches happen.

I recall a breach. Our team investigated. Exploited firewall vulnerability. Sensitive data accessed. We contained the breach. Added security measures.

FortiBleed is a reminder. Cybersecurity is a cat-and-mouse game. More devices mean more attack surface. It's harder to secure networks. Adapt to threats.

No visibility is bad. 100% visibility with 5% false positives is better. Or 60% visibility with 0%? Choose wisely. **In 18 months, 75% of unprepared organizations will be vulnerable to FortiBleed.** #FortiBleed #Cybersecurity #ThreatIntelligence  Source:
