

FIRESTARTER backdoor hit a federal Cisco Firepower device. No warning. My team's shift-left efforts just got a reality check. Exploit evaded detection for months. Novel obfuscation technique, likely. We're re-evaluating our DevSecOps pipeline. Integrate security earlier. Integrate security better. Two options: Patching all Cisco devices now. Or waiting. Conduct a network scan. Review SOAR rules. Catch similar TTPs. Patching today or waiting for the cycle?
