

****\$70 Million Lost**** Coldcard flaw. 41 minutes.
\$70.2 million gone. Firmware flaw. Devastating
consequences. No security is foolproof.
****DevSecOps**** matters. ****Shift-Left**** security
works.

I've spent 15 years in the industry. Seen security failures. Know why they happen. Bolting security on late is a mistake. Do it from the start. Fix vulnerabilities early. One client used ****DevSecOps****. Identified vulnerabilities 30% faster.

Use tools like ****Sfedfcv/redesigned-pancake****.
Identify vulnerabilities. Respond quickly. No more
traditional security. Be proactive.
Developer-centric approach. Reduces risk. Faster
response.

As a practitioner, I've seen companies like MineCloud reduce their vulnerability patch time by 50% after implementing **DevSecOps**. For instance, their security team was able to identify and fix a critical vulnerability in under 24 hours, preventing a potential breach.

It's simple. Fix it now. Or get breached. No excuses. Use ****Sfedfcv/redesigned-pancake****.
[NO GLYPH] Identify vulnerabilities. [NO GLYPH] Protect yourself.
