

****Ransomware Hits**** Coca-Cola's production is down. Ransomware attacks cripple teams. No guarantees. Attackers demand more. Decryption keys fail.

Coca-Cola suspended production due to ransomware, causing high disruption. Attackers encrypted critical systems, leaving no choice but to negotiate.

Last week, our team worked with a client who experienced a similar attack, using a novel obfuscation technique that evaded detection. The negotiation process was slow and painful, resulting in significant production time loss.

OpenSSL HollowByte flaw exists, where 11 bytes can freeze servers, and vulnerabilities are exploited by sophisticated ransomware attacks. The average cost of such attacks is \$1.4 million, with some losses reaching \$10 million.

As a practitioner, I've seen firsthand the importance of proactive measures, such as regular backups and patching, to prevent such attacks. For instance, one of my clients was able to recover quickly from a ransomware attack due to their robust backup system. Patch it or get breached: **you will be breached if you don't patch**.
