

****Supply Chain Breach**** Miasma Worm hits. 73 ****GitHub**** repositories affected. Four organizations compromised. ****Zero-Trust**** is key. It's not just a technology solution. Every user and device is untrusted.

Our team encountered a backdoor in an internal project, where a dependency was malicious, but ****Zero-Trust**** controls flagged it due to unusual behavior, and we caught it before a breach occurred.

It's about no trust - ****Zero-Trust**** models work by minimizing the blast radius in case of a breach. [1] Tool: ****jettbrains/-L-**** ([1] 143) helps analyze dependencies to identify vulnerabilities before they're exploited.

No ****Zero-Trust****? You're vulnerable. In 12 months, every organization will be hit by supply chain attacks like Miasma Worm. ****Will your organization be 100% prepared or 60% exposed?****  Source:
