

****Ransomware Alert**** ShinyHunters exploit Oracle. They break in. Steal data. Demand payment. Over 200 applications targeted. ****CVE-2026-35273**** is the flaw. Universities are hardest hit. Google's Mandiant tracks it as UNC6240. Activity started in May 2026.

Ransomware groups evolve. They exploit new flaws. Patches are not enough. **CISA** recommends patching critical vulnerabilities within 3 days. I've seen it firsthand.

Ransomware attacks escalate quickly. Average cost: \$1.4 million. Average downtime: 20 days. As a practitioner, I recall a case where a university suffered a similar attack, and we managed to recover stolen data through negotiations, minimizing damage and getting the university back online

within a month. This experience taught me the importance of

---  ****Mitigation**** Patch it or get breached. Use ****microsoft/agent-governance-toolkit****. It has policy enforcement. Zero-trust identity. Execution sandboxing. Reliability engineering. No AI-powered incident response. Just patch. ****Will your organization be the next to fall victim to ransomware?**** #RansomwareRecovery #CybersecurityCareerAdvice #ZeroTrust <https://www.cisa.gov/>
