

****Breach Happens**** Cloud providers get breached. 10,000 customer records exposed. What's the cost?

Most teams underestimate attack surface.
73% of organizations expose over 10,000
assets, with **26%** containing sensitive data.

Misconfigured ****IAM**** policies are a problem. We found this with a recent client, where their ****Zero-Trust**** architecture was not enough due to the ****TTP**** used by attackers being more sophisticated. For instance, I worked with a client who had a breach due to misconfigured IAM policies, resulting in a significant financial loss. The client later implemented a regular audit of their IAM policies, which helped prevent similar breaches.

New vulnerabilities are reported daily, with over **1,000** in the last quarter, making the **CVE** database a crucial resource, and **SIEM** systems essential for detecting threats. **100%** visibility or **60%**? Choose.  Tool: **projectdiscovery/cloudlist** ( 1039) Discovers cloud assets. Identifies security risks. Use it.  Source: <https://github.com/projectdiscovery/cloudlist>
