

****Exploit Alert**** ****ShieldBreak**** dropped on Patch Tuesday. It's bad. Over 10,000 systems compromised in 24 hours. ****ShieldBreak**** spawns a shell with System privileges on Windows systems.

Exploits like ****ShieldBreak**** turn patching into a cat-and-mouse game. One misstep, and attackers gain access. I recall last week's incident: think fast, contain damage. As a practitioner, I've seen firsthand how quickly ****ShieldBreak**** can spread - in one case, a client's system was compromised in under an hour, highlighting the need for swift action.

Our team develops a response plan. **SOC** operations and analyst training detect and mitigate this threat. We work with **CISA** to share intelligence. Assume every system is vulnerable. Plan accordingly.

---  **Metasploit** is essential.
Advanced exploit development and
testing capabilities.

100% visibility into system vulnerabilities, but 5% false positives? Or 60% visibility with 0% false positives? **Will your system be the next to fall to ShieldBreak?**
