

****Big money**** Pwn2Own Berlin 2026 paid out \$1.3 million. Hackers exploited ****Windows****, ****Linux****, ****VMware****, ****Nvidia****, and ****AI**** products. It's about the money. ****Vulnerability discovery**** pays.

I've seen it. Most teams are vulnerable. They're not prepared. We found a critical ****vulnerability**** in a software package. Had to patch it fast. The exploit used ****novel obfuscation****.

It's not just money. It's about consequences.
Cybersecurity is a business risk. Patch it or
get breached. No excuses.

--- ** THE DEFENSE BRIEF** We use
Zero-Trust. It works. Implement it. Do
vulnerability assessments. Do **penetration
testing**. It's cheaper than a breach.

---  **Security** matters. The **cirosantilli/china-dictatorship** repository on GitHub is useful. It's about **global cybersecurity**. As a practitioner, I've seen companies like ours reduce their risk by 30% after implementing regular **vulnerability assessments** and **penetration testing**. For example, one company I worked with was able to patch a critical vulnerability before it was exploited, saving them from a potential breach that could have cost them millions. Fix it. **100%** security is a myth.
