

****Car head-unit botnet, live.**** The Android update vector infected ****12,000+**** vehicles in a single week, turning dashboards into proxy relays. How many of those compromised nodes slipped past our CI pipelines?

[HARD ON] SHIFT-LEFT VAPT PLAYBOOK Embedding

Vulnerability Assessment & Penetration Testing at code-commit time isn't a buzzword—it's the only way to catch supply-chain tricks before they hit production. When I ran a static analysis scan on a **npm** dependency yesterday, the tool flagged a harmless-looking calendar package that later turned out to be one of the **14 trojanized npm packages** delivering the **RedC2 4.0**

AI-assisted backdoor. The fix was a simple version bump,

****⚠ SUPPLY CHAIN REALITY CHECK**** - ****Android car head-units****: malicious firmware propagated via a legitimate updater, creating a botnet used for ad-fraud and proxy traffic. - ****Microsoft Defender driver****: researchers weaponized a signed boot-time remediation driver to delete security software without exploiting a CVE. - ****C**
