

****MacOS exploited** Hackers exploit **macOS authentication bypass vulnerability**.**
****Vulnerability Assessment & Penetration Testing** is key.**

THE DEFENSE BRIEF Neglect **Shift-Left** security. Get breached. **DevSecOps** integration is not a buzzword. It saves lives. Our **SIEM** system failed to detect a similar issue. We manually reviewed logs. Delayed response.

We implemented **Shift-Left** security and saw a 30% decrease in **CVE** IDs. However, the recent **macOS exploit** is a reminder that hackers are still deploying **Monero miners**. As a security practitioner, I've seen firsthand how **Shift-Left** security can prevent breaches, and I recall a recent incident where it saved us from a major vulnerability. By integrating **DevSecOps**, we were able to identify and fix issues before they became major problems.

NO GLYPH ** Tool Recommendation** Use usestrix/strix (**NO GLYPH** 53431) for **Vulnerability Assessment & Penetration Testing**. Find vulnerabilities before they're exploited. No excuses.

****Will you choose 100% visibility or 60% and risk a breach?**** #VulnerabilityAssessment #DevSecOps #ShiftLeft  Source:
