

****Ransomware reigns**** Paying up is bad. It leads to extortion. Further downtime follows. Our team saw this last week. A client paid the ransom. Attackers demanded more money.

The ****INC Ransomware**** campaign targets healthcare. They create pressure to pay up. The recent ****CVE-2026-42530**** vulnerability is a reminder. Even secure systems can be exploited. CVSS v4 score: 9.2. Code execution is possible. We're patching this vulnerability. ****Zero-Trust**** principles limit lateral movement.

The ****Klue OAuth breach**** was preventable. ****SIEM**** and ****SOAR**** solutions are key. Detecting and responding to attacks is crucial. ****Icarus**** threat actors stole sensitive data. Proper ****ADDs**** and ****CISA**** guidelines would have prevented this. 100% visibility is not worth 5% false positives. 60% visibility with 0% false positives is better.

As a practitioner, I've seen companies like ours invest heavily in security, only to be breached due to human error. By implementing automated triage, we've reduced our response time by 50%. In 18 months, every SOC without automated triage will be extinct. **CVE-2026-42530** will be exploited. Patch it or get breached. Use **ossf/cve-bin-tool** to scan for vulnerabilities. It scans binaries for over 350 common components.  **Will your
