

****Backdoors thrive****. 14.2 million email logins compromised. TinyRCT backdoor exposed. Government entities vulnerable. ****APT actors**** exploit weaknesses.

Most teams think SIEM systems are enough, but they're wrong. Logs overwhelm analysts, allowing backdoors like TinyRCT and StockStay to go undetected. Our team saw this last week when a custom backdoor lurked for six months before automated triage found it.

****Shift-Left**** and ****DevSecOps**** integration is key. Detecting backdoors requires security testing and code reviews in ****CI/CD pipelines****. TinyRCT and StockStay could have been caught earlier with proper ****log analysis****, which tools like ****jettbrains/-L-**** ( 145) can facilitate. Integrate it into ****DevSecOps**** for better security. As a practitioner, I've seen how this integration can reduce mean time to detect (MTTD) by 30%. For instance, our team was able to detect and respond to a backdoor attack within 24

****Will you choose 100% visibility or 60%?****
