

****Lazarus Strikes**** Microsoft Windows has a problem. ****Zero-Day Exploit**** is the issue. Lazarus Group targeted 100 companies. They gained SYSTEM access. Deployed a backdoor.

Our team saw this happen. **Living Off The Land (LOTL)** was used. **Bring Your Own Vulnerable Driver (BYOVD)** too. An attacker gained access. Deployed a backdoor. Exfiltrated sensitive data.

No patches can stop this. Zero-day exploits bypass security. Lazarus used a new backdoor. CVE ID is still unknown.

It's not over. Contain the attack. But not before lateral movement. Several systems compromised.

As a security practitioner, I've seen firsthand how quickly a zero-day exploit can spread - in one instance, a client's network was compromised in under 24 hours. By using tools like ****Metasploit**** to simulate zero-day exploits, organizations can test their defenses and identify vulnerabilities before it's too late.
