

****Cyber War**** Hackers hijack hotel Wi-Fi. Over 100 cases reported. ****DNS settings**** exploited to steal ****Microsoft 365**** accounts.

Most teams trust **VPNs**. Wrong.
VPNs can be vulnerable. Attackers intercept data.

Last week, a client fell victim to a **DNS hijacking** attack, which we contained and implemented new security measures for. Our team's swift response prevented further damage, and the client has since prioritized regular security audits.

Certighost exploit is bad. Allows low-privileged **Active Directory** users to impersonate **Domain Controllers**. Prioritize **vulnerability assessment** and **penetration testing**.

--- ** THE DEFENSE BRIEF** Implement security strategy. Regular **vulnerability assessments**. **Penetration testing**. Employee education.

Use **SummitRoute/osxlockdown**.
Audit security settings. Remediate
issues.

No strategy? Get breached.
SummitRoute/osxlockdown (775)
helps.

Visibility matters. 100% visibility or 60%? Choose.

|| **Will you patch your systems before it's too late?** ||
