

Replication turned into a backdoor

A single replication request can grant permanent superuser rights and a hidden backdoor, letting attackers own the entire database. How many SOCs are still treating replication traffic as low-risk?

**** [REDACTED] THE DEFENSE BRIEF **** The newly disclosed ****CVE-2026-6471****—nicknamed ***PostGRESHell***—exploits a 12-year-old flaw in PostgreSQL's logical replication protocol. By sending a crafted replication packet, an adversary escal

Last quarter, a client ignored replication alerts and suffered a silent takeover that went undetected for 48 hours. After patching, their breach window shrank to under 2 hours.

****If you're still treating replication as low-risk, expect a breach within weeks.****
