

****Ransomware hits**** ****Cloudlist**** has 1039 GitHub stars. It lists assets from multiple cloud providers. Ransomware demands increased 45% in a year, with some reaching \$50 million. No cloud asset inventory? You're exposed.

Most ransomware attacks are planned, exploiting vulnerabilities. **Cloudlist** helps identify unprotected assets and secure them to prevent attacks. I recall a ransomware negotiation last week where **Cloudlist** helped us identify compromised assets and contain the attack. Attackers know the target's infrastructure and have the right tools, so it's crucial to stay ahead. As a practitioner, I've seen firsthand how **Cloudlist** can be a game-changer in preventing ransomware attacks, and I've

--- **Cloud Security** **Cloudlist** is essential for listing assets from multiple cloud providers, identifying vulnerabilities, and securing your cloud infrastructure. No inventory? You're vulnerable - will you choose 100% visibility or 60%? **Will you be the next ransomware target?**
