

****DarkSword Unleashed**** ****New threat****. Over 100 web properties identified by Censys use the ****DarkSword**** exploit kit. Threat actors adapt fast, deploying ****GHOSTBLADE**** on iOS devices, posing a big risk.

Our team tracks this campaign, which is alarming, as they adapt fast, deploying new exploits quickly with a novel obfuscation technique, making **GHOSTBLADE** malware hard to detect. Last week, a similar campaign leaked an exploit kit that targeted Android devices, compromising many devices.

No security framework is safe, as sophisticated threat actors bypass them, as seen with **DarkSword** and **GHOSTBLADE**. Continuous monitoring is key, and incident response is crucial, but without a plan, you're done: they will bypass, and it's happening now - 18 months without an incident response plan will be devastating.

As a security practitioner, I've seen firsthand how quickly threats can escalate, and in one instance, a client's lack of monitoring led to a breach that could have been prevented with the right tools. By utilizing tools like ****Sfedfcv/redesigned-pancake**** (255), you can gain 100% visibility into your risks and make informed decisions to mitigate them. ****Will you choose 100% visibility or 60% and risk being breached?**** #iOSsecurity
