

****Cyber War**** Russian state-supported group exploits ****Zero-Day**** vulnerability in Zimbra's webmail client. Steals email and 2FA codes. Affects multiple Western organizations. They target the last 90 days of email. Entire email directory. Saved browser passwords. 2FA codes.

Firewalls fail. Intrusion detection systems fail.
Sophisticated threat actors bypass controls. Use
Zero-Day Exploits. Move laterally. Exfiltrate
sensitive data.

Our team sees this. Recent engagements. Initial breach via email account. Attackers pivot. More sensitive areas. Last week, a client's email system was compromised, but we contained and eradicated the threat by implementing ****Zero-Trust**** architecture, ****Multi-Factor Authentication**** (MFA), and ****Encryption****.

No guarantees exist, as a single misconfiguration or zero-day exploit can lead to a breach. ---  **MITRE ATT&CK** framework helps. Identify vulnerabilities. Prioritize patches. **arainho/awesome-api-security** ( 3858) is useful. API security tools. Resources.

Will your organization be the next to fall to a zero-day exploit? #CyberSecurityAwareness #ZeroTrust #APIsecurity  Source:
