

Cyber threat FortiBleed actors collaborate with Inc. They exploit **Nextcloud** zero-day bugs. Bad news. They monetize access to thousands of **Fortinet** firewalls. **Ransomware** attacks follow. These breaches are not contained. They're starting points for larger attacks.

The FortiBleed actors use ****obfuscation techniques**** to evade detection. One of our clients was attacked last week. The attack was sophisticated. It used a novel ****obfuscation tactic****. Similar to the one described in the FortiBleed incident.

****Zero-day**** bugs are the problem. The Nextcloud bug gives attackers access to sensitive data. They extort money from victims. ****Cyberattacks**** are growing in sophistication. The FortiBleed actors monetize their access. This is a ****red flag****.

Patch it or get breached. Use **Zero-Trust** architectures. Implement **SIEM** systems. Stay up-to-date with **threat intelligence**. Respond quickly to attacks. As a practitioner, I've seen firsthand how a swift response can mitigate damage, and in one case, we reduced the attack surface by 80% within 24 hours. By prioritizing cybersecurity, organizations can avoid becoming the next victim of a **ransomware** attack.

In 12 months, every organization without a cybersecurity strategy will be vulnerable. **Would you rather have 100% visibility into your network with 5% false positives, or 60% visibility with 0%? ** ---  Tool Recommendation: **Fortinet Firewall Analyzer** - this tool can help identify potential vulnerabilities in **Fortinet** firewalls.
