

****Undetected for a year**** China-Nexus Actor breached US researchers. Over 100 institutions affected. ****RedCAP**** credentials exploited. They evaded detection. For a year. Sophisticated actors exploit vulnerabilities. ****SIEM**** systems misconfigured. Novel obfuscation techniques used. Custom ****malware**** variants.

Google discovered the China-Nexus Actor's campaign. Stole **RedCAP** credentials. Breached numerous institutions. Exfiltrated sensitive data. **Vulnerability Assessment & Penetration Testing (VAPT)** is necessary. Identify vulnerabilities before exploitation. Reduce breach risk. As a practitioner, I've seen firsthand how VAPT can help organizations like a hospital I worked with, which was able to identify and patch a critical vulnerability before it was exploited, thanks to regular VAPT exercises. This experience

---  **VAPT** works. It identifies vulnerabilities. Before they're exploited. Use **infosecninja/Red-Teaming-Toolkit**. Simulate attacks. Identify vulnerabilities. Will you choose 100% visibility or 60%? #VAPT #RedTeaming #Cybersecurity  Source:
