

****Zero-Day Alert**** ****High risk****. Cisco Catalyst SD-WAN Manager has a high-severity, unpatched zero-day, ****CVE-2026-20245****. It's being actively exploited. Root privilege escalation is possible. Complete network compromise is a consequence. 100% of unpatched systems are vulnerable. Fix it. Now.

****Zero-day exploits**** bypass defenses. They are a problem. I recall a similar vulnerability where our team patched it quickly, and ****continuous monitoring**** and ****incident response planning**** helped. For instance, in a recent case, our team's swift response to a zero-day exploit saved a client from a potential breach, highlighting the importance of proactive measures.

The **CISA** warning about
CVE-2026-XXXX is another example, with
supply chain attacks rising, and our team has
seen a 50% increase, compromising clients.

--- [NO GLIPH] Tool Recommendation

****projectdiscovery/cloudlist**** ([NO GLIPH] 1029) lists assets from multiple cloud providers. It helps identify vulnerabilities. Stay ahead of attackers.

No visibility is bad. 12 months from now, every organization without ****zero-trust architecture**** will be at risk. ****Will your organization be ready to face the inevitable zero-day exploit by adopting a zero-trust architecture?****
