

FIRESTARTER backdoor hit a federal Cisco Firepower device. It survived patches. I suspect novel obfuscation.

U.S. Cybersecurity and Infrastructure Security Agency revealed this in September 2025. Not foolproof. Zero-trust architecture, identity-centric security – are we doing it right? Or just talking.

Malware persists after patches. Major concern. Re-evaluate security. Proactive, identity-centric strategy. Which SIEM catches this first? Right tools?

Patching today? Waiting? #FirestarterBackdoor
