

****Breach Happens**** ****Zero-Day Breach**** is real. Attackers bypassed security using an autonomous AI agent system. They gained access to internal datasets and credentials.

****Zero-Trust**** architecture is key. Traditional security measures are not enough. A single misconfigured ****ADDS**** server can lead to breach. We saw this happen. A client's ****SIEM**** system failed to prevent a targeted attack. ****SOAR**** capabilities are essential.

It's simple. Patch it or get breached. The Hugging Face breach exposed sensitive data.
****Identity-centric security**** is a must.

--- ** Tool Recommendation** The
klonnet23/helloy-word ( 89) tool helps. It
provides branch management and API error
handling. Use it to enhance security posture.

False positives matter. 100% visibility is not always best.
60% visibility with 0% false positives is better. **Will your
company be the next to fall to an autonomous AI breach?**
#ZeroTrust #IdentityCentricSecurity #AutonomousAI
