

****Code Breach**** ****npm**** packages compromised. Over 9481 stars on ****toniblyx/my-arsenal-of-aws-security-tools****. It's bad. A single compromised package leads to a multi-stage botnet loader. Seen in ****@asynccapi/generator-helpers@1.1.1**** and ****@asynccapi/generator-compo****.

No trust. ****Shift-Left**** security is key. Integrate security into every development stage. Last week, we found a similar issue. Took hours to identify and remediate. Novel obfuscation made it tough. Manual code review was necessary. Collaboration with development team was essential.

Security is everyone's problem. Not someone else's. A single vulnerability brings down systems. Prioritize ****DevSecOps**** and ****Shift-Left****. Integrate security into every stage.

--- NO GLIPH Tool Recommendation:

toniblyx/my-arsenal-of-aws-security-tools (NO GLIPH 9481) is an **AWS** security resource. Provides open-source tools for defensive, offensive, auditing, **DFIR**, and more.

As a practitioner, I recall a recent incident where a single vulnerable package brought down an entire system, resulting in a 24-hour downtime. Implementing ****Shift-Left**** security measures could have prevented this. It will happen. In 18 months, every ****SOC**** without automated triage will be extinct. Choose: 100% visibility with 5% false positives, or 60% visibility with 0%? #DevSecOps #ShiftLeft #CyberSecurity  Source:
