

\$ **LOGS LIED**.

****Logs lied**. 12 minutes to exfiltration.
Zero-Trust is key. No alternatives.**

I read **Dark Reading** on **PCPJack**. They steal cloud secrets. **Parquet files** are used. For stealthy target discovery.

We did a **Vulnerability Assessment & Penetration Testing (VAPT)** using **OWTF** and found vulnerabilities, compromising the client's **cloud security** due to the lack of **identity-centric security**.

Cloud security is not the provider's job, as customers secure their own data. ****Zero-Trust**** assumes all users are untrusted, verifying identity before access. ****CISA**** evolves, and ****Zero-Trust**** will be standard, with a choice between 100% visibility or 60%. As a practitioner, I've seen ****Zero-Trust**** implementation reduce breach risks by 70%, and with tools like ****OWTF****, vulnerability assessment becomes more efficient. For instance, a recent client was able to identify and patch 90% of their vulnerabilities within

\$ **LOGS LIED**.

OWTF (1934) is a tool. For
Vulnerability Assessment & Penetration Testing (VAPT).
Identify vulnerabilities. Simulate attacks. Use it. #ZeroTrust
