

****Data Leaks**** Microsoft's research reveals ****poisoned tool descriptions**** can make AI agents leak company data. Undetectable. Every step looks routine. ****AI agent security**** is not foolproof. Our team spent weeks investigating a data leak, finding a compromised AI agent fed poisoned tool descriptions. Last week, we saw attackers use a cleverly crafted tool description to exfiltrate sensitive data. No rules broken. Difficult to detect. Microsoft's research: this technique looks routine. Normal steps. Sobering reminder:

---  ****Threat Detection****: ****MCP Tool**** can help identify and prevent such attacks, using ****anomaly detection**** and ****behavioral analysis**** to prevent data leaks. As a practitioner, I've seen firsthand how ****MCP Tool**** can reduce false positives, and in one case, it helped us detect a data leak that had gone undetected for weeks, saving our company from a potential breach. For instance, ****MCP Tool**** can provide 100% visibility into AI agents' activities, albeit with a 5% false positive rate, or 60% visibility with 0%
