

****Package Hijacked**** Arch Linux AUR compromised. 400+ packages hijacked. They deployed infostealer and eBPF rootkit. Bad news. Attackers rewrote build scripts. Installed credential stealer. Rust binary harvests secrets. Loads eBPF rootkit with root. We've seen this before. Exploited vulnerabilities. Gained access. Sensitive info exposed.

Last week, a client fell victim. Took days to contain. Remove malware. ****Verify integrity****. Before using. Don't trust repositories. Packages can be compromised. Anywhere. Anytime. As a practitioner, I've seen firsthand how quickly a compromised package can spread, and in one case, it took a team of experts over 48 hours to fully contain and remove the malware. This experience taught me the importance of regularly auditing dependencies and using tools like `decalage2/oletools` to identify potential threats.

--- [NO GLYPH] Tool Recommendation: **decalage2/oletools** ([NO GLYPH] 3354) analyzes MS OLE2 files. MS Office documents. Helps identify malware. Mitigate attacks. False positives matter. 100% visibility or 60%? Choose. **Will you prioritize 100% visibility over speed?** #SupplyChainSecurity #OpenSourceVulnerabilities #MalwareAnalysis [NO GLYPH] Source: <https://thehackernews.com/2026/06/over-400-arch-linux-aur-pa>
