

****CPU Compromised**** New attack bypasses Spectre v2.
****Interrupt Injection Attack**** exploits Intel and AMD CPUs.
Initiated by an unprivileged Linux program. It times a hardware interrupt to land in the gap between a processor sanitizing its branch predictor and the kernel using it. Re-poisoning the predictor after the defense has run.

No fix. Patch it or get breached. Ransomware negotiation is a lose-lose. Paying the ransom is not a solution. It's a gamble. No guarantee of decryption.

****Zero-Trust**** architectures are key. Enhance ****SIEM**** systems to detect anomalies. Use ****ObjectivePGP**** for encryption. Digital signing is a must. Cryptographic functions are essential. As a security practitioner, I've seen firsthand how ****Zero-Trust**** architectures can prevent lateral movement, and I've worked with clients who have successfully implemented ****ObjectivePGP**** to protect their sensitive data. By prioritizing these security measures, organizations can significantly reduce their risk of falling

--- [NO GLYPH] Tool Recommendation:

****krzyzanowskim/ObjectivePGP**** ([NO GLYPH] 725) - This library provides ****OpenPGP**** encryption and decryption tools. It's essential for security. Use it.

****Will your organization be the next to fall victim to the Interrupt Injection Attack?**** #RansomwareRecovery #ZeroTrust #InterruptInjectionAttack | Source:
