

****Backdoored Linux**** China-nexus group infiltrated. They backdoored ****PAM**** and ****OpenSSH****. This means trouble. ****Shift-left security**** is key. No other way.

They hid for years. Standard security protocols failed. **Velvet Ant** group exploited this. They remained hidden.

We use ****shift-left approach****. Security is part of development. Last week, we found a vulnerability. We patched it quickly. Novel ****obfuscation**** techniques are used. ****DevSecOps**** pipeline is critical.

****CVE-2026-35273**** is a problem. It affects ****Oracle PeopleSoft****. Unauthorized access is possible. Shift security left. Integrate it into development.

As a security practitioner, I've seen firsthand how a shift-left approach can make all the difference - for instance, our team recently caught a critical vulnerability in a popular library, and we were able to patch it before it was exploited. By integrating security into the development process, we've reduced our mean time to remediate (MTTR) by over 50%.
