Shipping data vanished overnight WhiteArmor claims to have exfiltrated 100 GB and is demanding $5 million. Are we still treating ransomware as a post-incident problem instead of a development-phase failure?

$ **SHIPPING DATA VANISHED OVERN

🚨 SHIFT-LEFT ALERT The Maersk breach proves that waiting for a “detect-and-respond” window is dead-weight. Attackers are now embedding ransomware payloads directly into **CI/CD** pipelines, stealing data. Last quarter, I helped a logistics firm integrate secret scanning into their build pipeline. Within weeks, they caught a ransomware test payload before any code reached production. **Companies that don’t embed security early will see breach costs triple by 2025.**
