

****Patching fails****. 20% of vulnerabilities are exploited within 24 hours. Traditional patching strategies are ineffective.

****Zero-day exploits**** happen fast. The Brazilian Banking Trojan spreads in Portugal. 30% of attacks target financial institutions.

Our team sees similar trends. Exploit attempts increase within hours of disclosure. ****Zimbra zero-day**** was used to exfiltrate emails. Months of sensitive information were stolen. This incident highlights the need for ****DevSecOps****. Integrate security into the development pipeline. Identify vulnerabilities earlier. Reduce the attack surface. Minimize exploitation risk.

Patching is not a silver bullet. Attackers are always ahead. The Chick-fil-A credential stuffing attack compromised 10,000 accounts. Proactive security is needed. Focus on prevention, not reaction. Automated triage is necessary. No automation means extinction. 100% visibility or 60%? **Will your company be the next to fall to zero-day exploits?**

\$ **PATCHING FAILS**. 20% OF VUL

---  **brosck/mantra** ( 921) helps hunt API key leaks.
Reduce the attack surface. Prevent exploitation. #ShiftLeft
