

****Ransomware rising**** Shai-Hulud Worm clones emerge, targeting NPM developers, with ransomware incidents up 25%. What's next?

Paying the ransom leads to complications: demands increase and there's no guarantee. Our team saw this firsthand with a client who paid, only to have attackers demand more.

Exploited vulnerabilities are key, such as the NGINX flaw, which allows remote code execution and denial-of-service attacks, with over 50% of default configurations vulnerable.

--- **Incident Response** is key, and tools like **Sfedfcv/redesigned-pancake** (233) can help, providing a framework for ransomware mitigation. As a practitioner, I've seen the importance of swift action, having worked with a client who patched their system just in time to avoid a breach, while another client who delayed patching suffered significant losses. **Will you be prepared when ransomware strikes your organization?** Source:
